

# 新一代 **IPv6** 網路協定

# Course Agenda

---

- **Module I: Introduction to IPv6**
- **Module II: IPv6 Operation**
- **Module III: IPv6 Configuration**

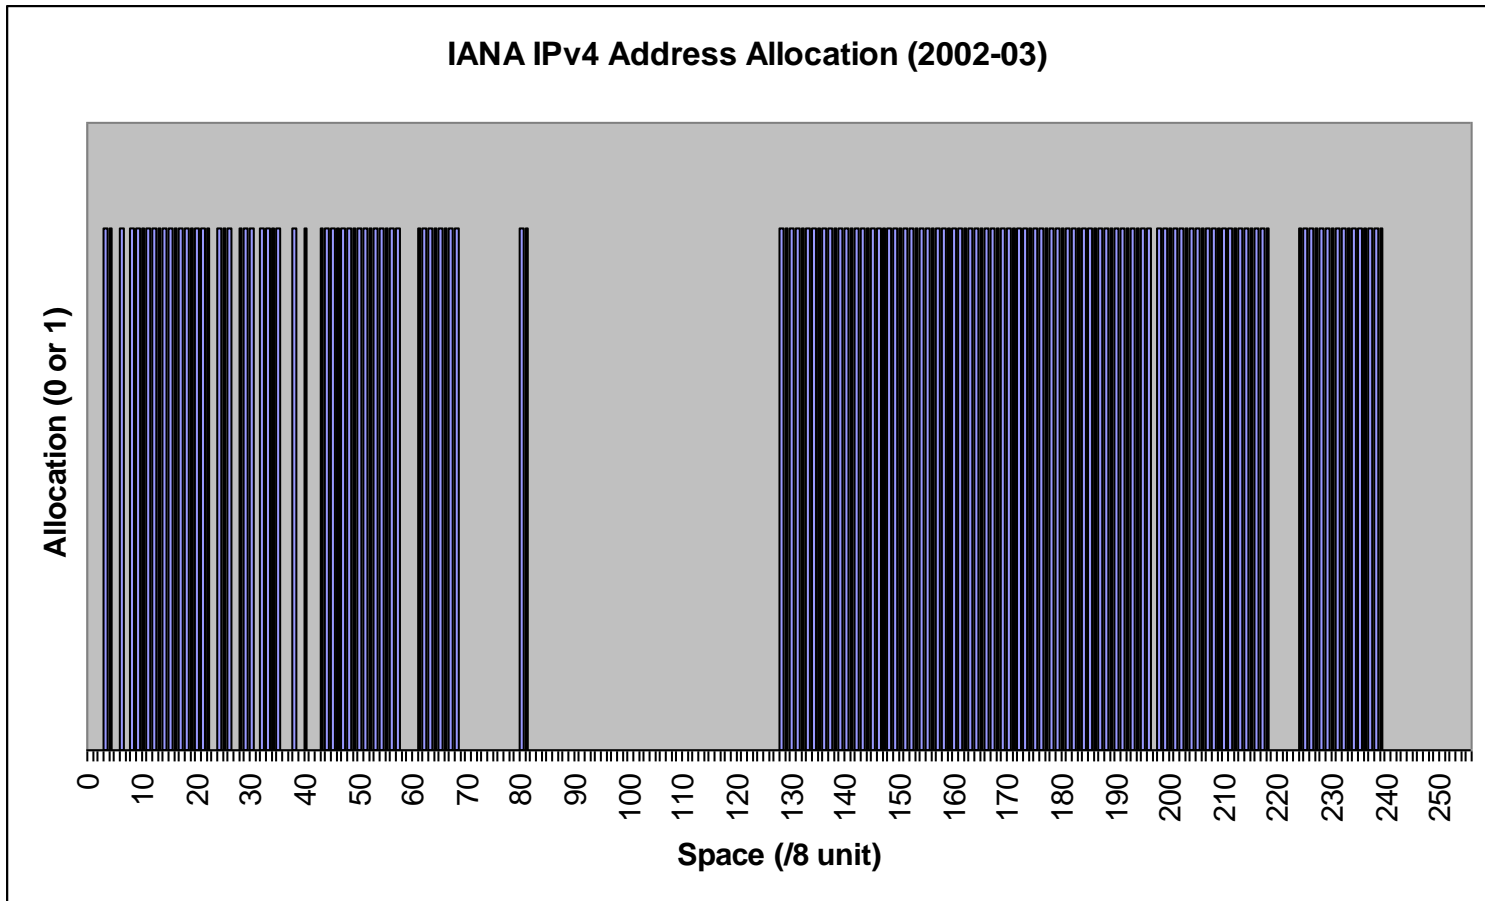

# **Module I**

# **Introduction to IPv6**

- 
- **Module 1.1: Rationale for IPv6**
  - **Module 1.2: IPv6 Features and Benefits**
  - **Module 1.3: IPv6 Header Format**

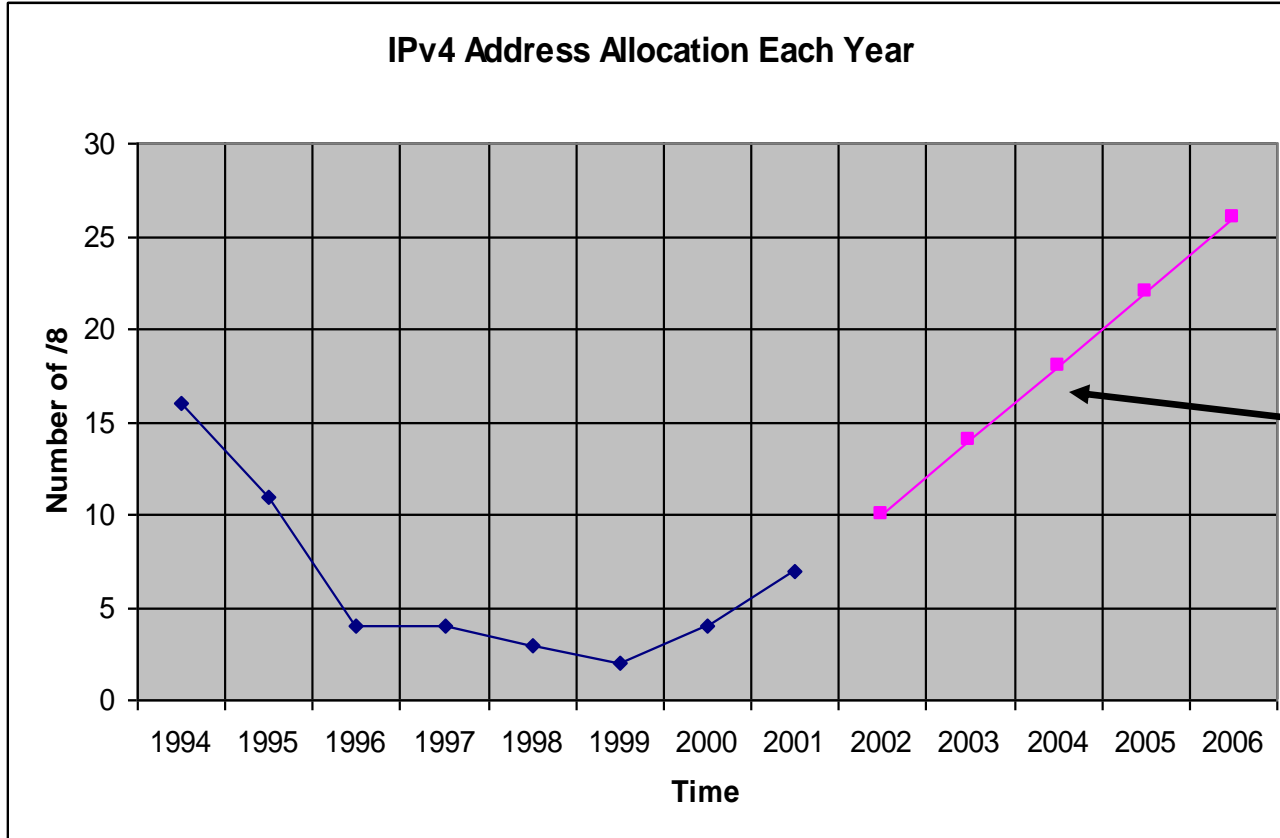

# **Module 1.1: Rationale for IPv6**

# IPv4 Address Space

**69% of space is allocated as of 2002-03 (Source: IANA registry)**

# Number of IPv4 Address Allocation in Recent Years

Linear extrapolation

# IPv4 Allocation Growth

**Cumulative  
using  
previous  
slide linear  
prediction**

**A linear model on the first derivative gives 2006 as complete exhaustion.**

# Short History of IPv6

---

- 1990 — Prediction of the exhaustion of IPv4 Class B by 1994.
  - 1991 — ROAD group formed to address routing.
  - 1992 — Prediction of the exhaustion of IPv4 addresses by 2005-2011.
  - 1993 — IPng Proposals solicitation (RFC 1550).
  - 1994 — CATNIP, SIPP, TUBA analyzed. SIPP+ chosen. IPng wg started.
  - 1995 — First specification: RFC 1883.
  - 1996 — 6Bone started.
  - 1997 — First attempt for provider-based address format.
  - 1998 — First IPv6 exchange: 6tap.
  - 1999 — Registries assign IPv6 prefixes. IPv6Forum formed.
  - 2000 — Major vendors bundle IPv6 in their mainstream product line.
- 

# Network Address Translation

---

- **Private address space and Network Address Translation (NAT) can be used instead of a new protocol**
- **NAT has many implications:**
  - **Breaks the end-to-end model of IP**
  - **Mandates that the network keeps the state of the connections**
  - **Makes fast rerouting difficult**

# NAT Inhibits Access to Internal Servers

When there are many internal servers that need to be reachable from outside, NAT becomes an important issue.

# **Module 1.2: IPv6 Features and Benefits**

# IPv6 Main Features

## Larger address space:

- Global reachability and flexibility
- Aggregation
- Multihoming
- Autoconfiguration
- Plug-and-play
- End-to-end without NAT
- Renumbering

## Mobility and security:

- Mobile IP RFC-compliant
- IPsec mandatory (or native) for IPv6

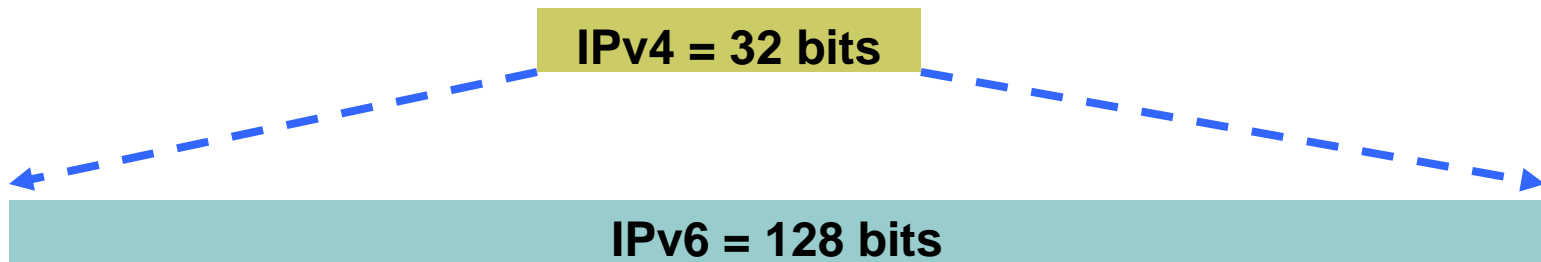

## Simpler header:

- Routing efficiency
- Performance and forwarding rate scalability
- No broadcasts
- No checksums
- Extension headers
- Flow labels

## Transition richness:

- Dual stack
- 6to4 and manual tunnels
- Translation

# Larger Address Space

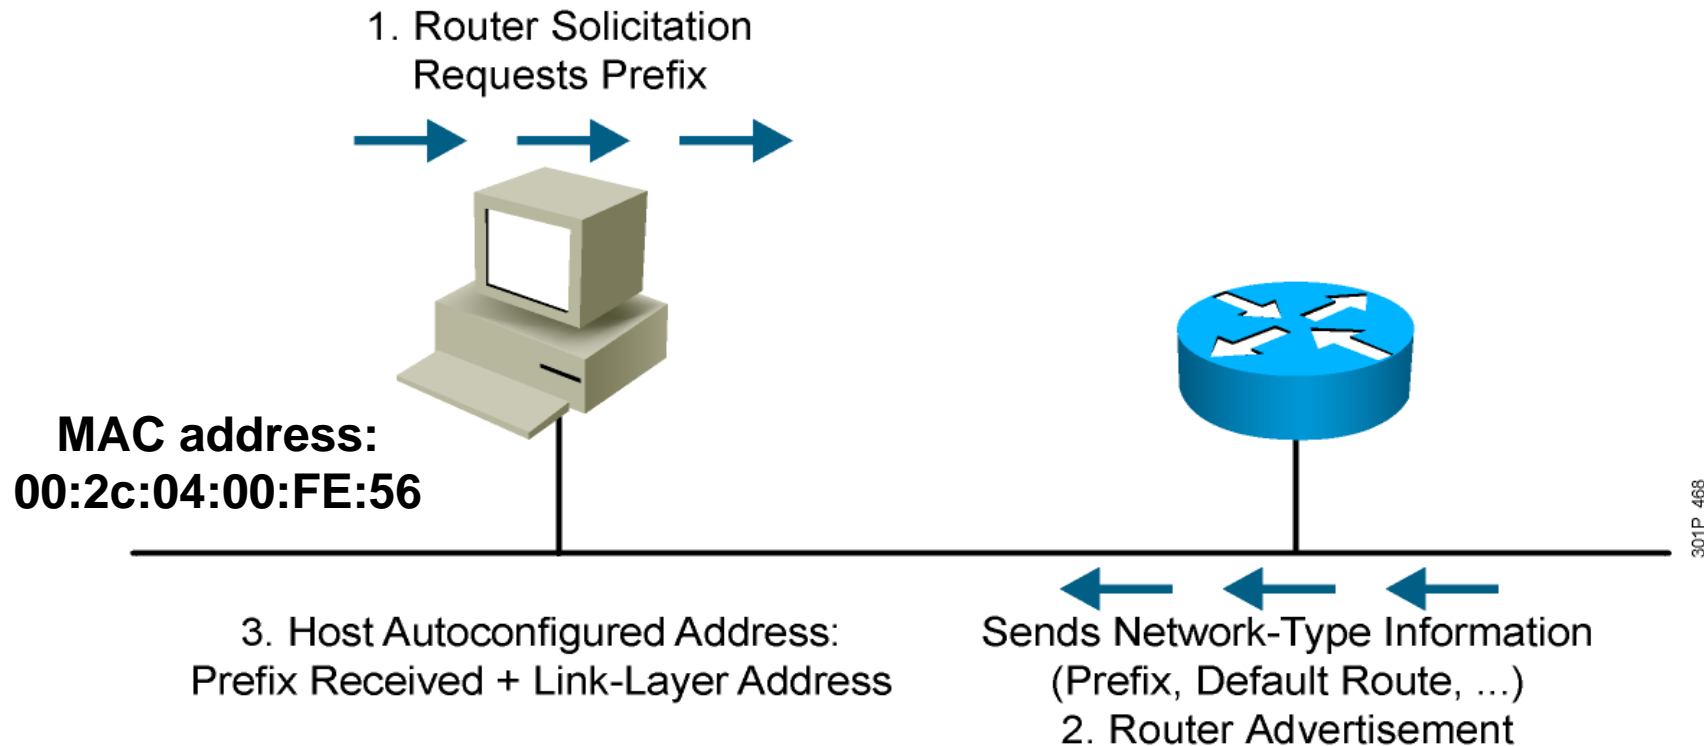

## IPv4

- 32 bits
- $\approx 4,200,000,000$  possible addressable nodes

## IPv6

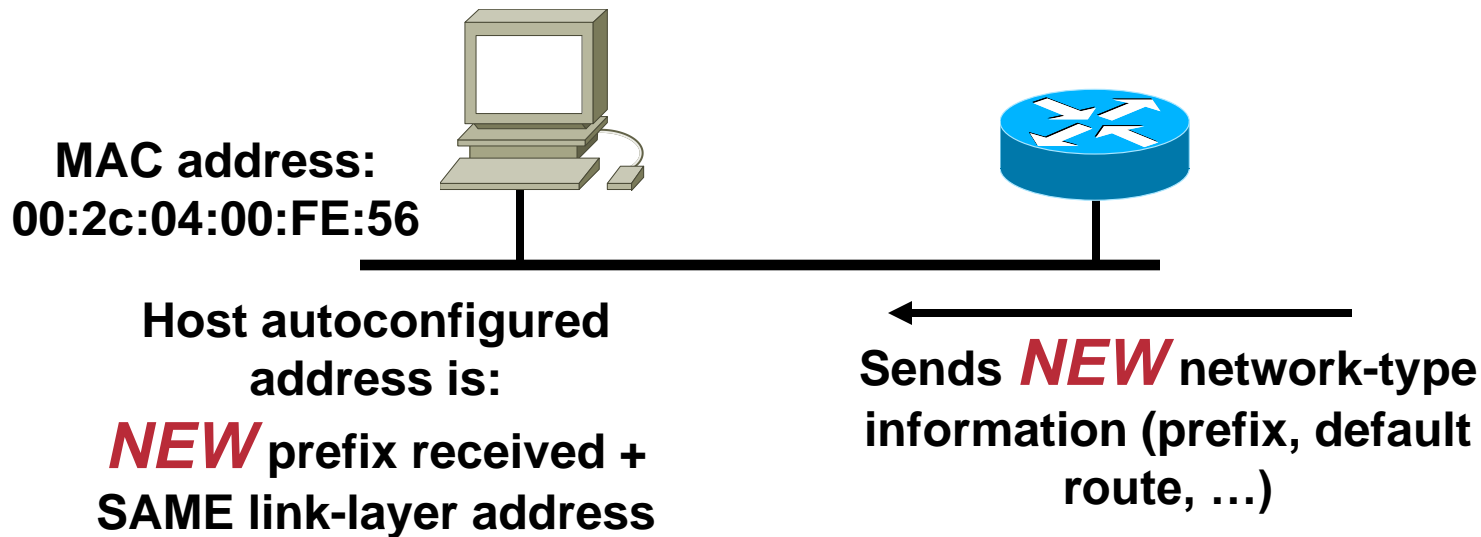

- 128 bits: 4 times the size in bits
- $\approx 3,4 * 10^{38}$  possible addressable nodes
- $\approx 340,282,366,920,938,463,374,607,432,768,211,456$
- $\approx 10^{30}$  addresses per person on the planet

# Stateless Autoconfiguration

- **The use of link-layer addresses inside the address space**
- **Autoconfiguration with "no collisions"**
- **Offers "Plug-and-play"**

# Renumbering

## Larger address space enables:

- Renumbering, using autoconfiguration and multiple addresses

# Multicast Use

---

- **Broadcasts in IPv4**
  - **Interrupts all computers on the LAN even if the intent of the request was for one or two computers**
  - **Can completely bring down a network ("broadcast storm")**
- **No broadcast in IPv6**
  - **Replaced by multicast**
- **Multicast**
  - **Enables the efficient use of the network**
  - **Multicast address range is much larger**

# Simple and Efficient Header

## Simpler and efficient header means:

- 64-bit aligned fields and fewer fields
- Hardware-based efficient processing
- Improving routing efficiency, performance, and forwarding rate scalability

# No Checksum

## Simpler and efficient header means:

- No checksum at the IP layer, no recalculation by the routers
- Improved routing efficiency, performance, and forwarding rate scalability
- Error detection is done by link layer and transport layer

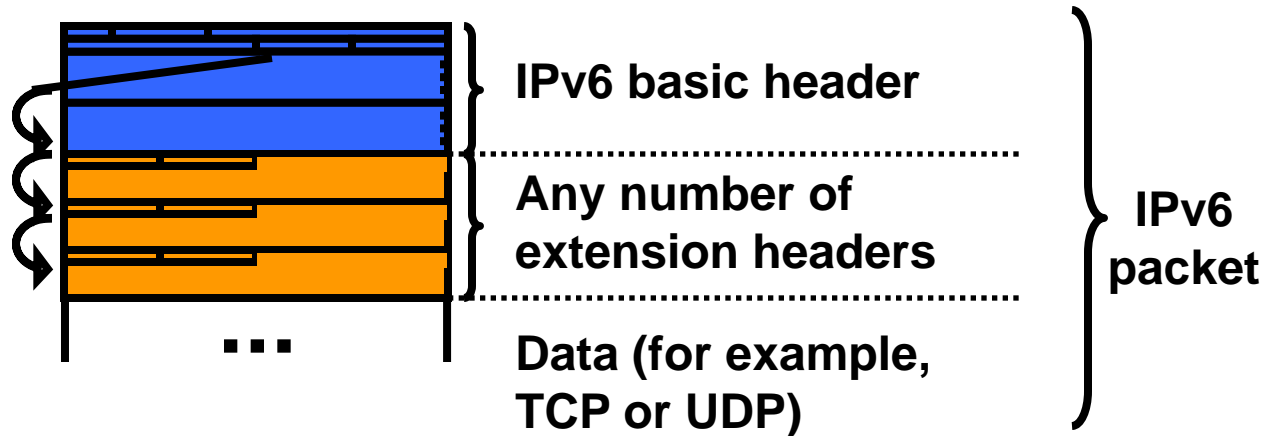

# Flow Label Field Enables Per-flow Processing

**Simpler and efficient header means:**

- A new flow label inside the IP header
- Enables per-flow processing for differentiation at the IP layer
- Length of 20 bits

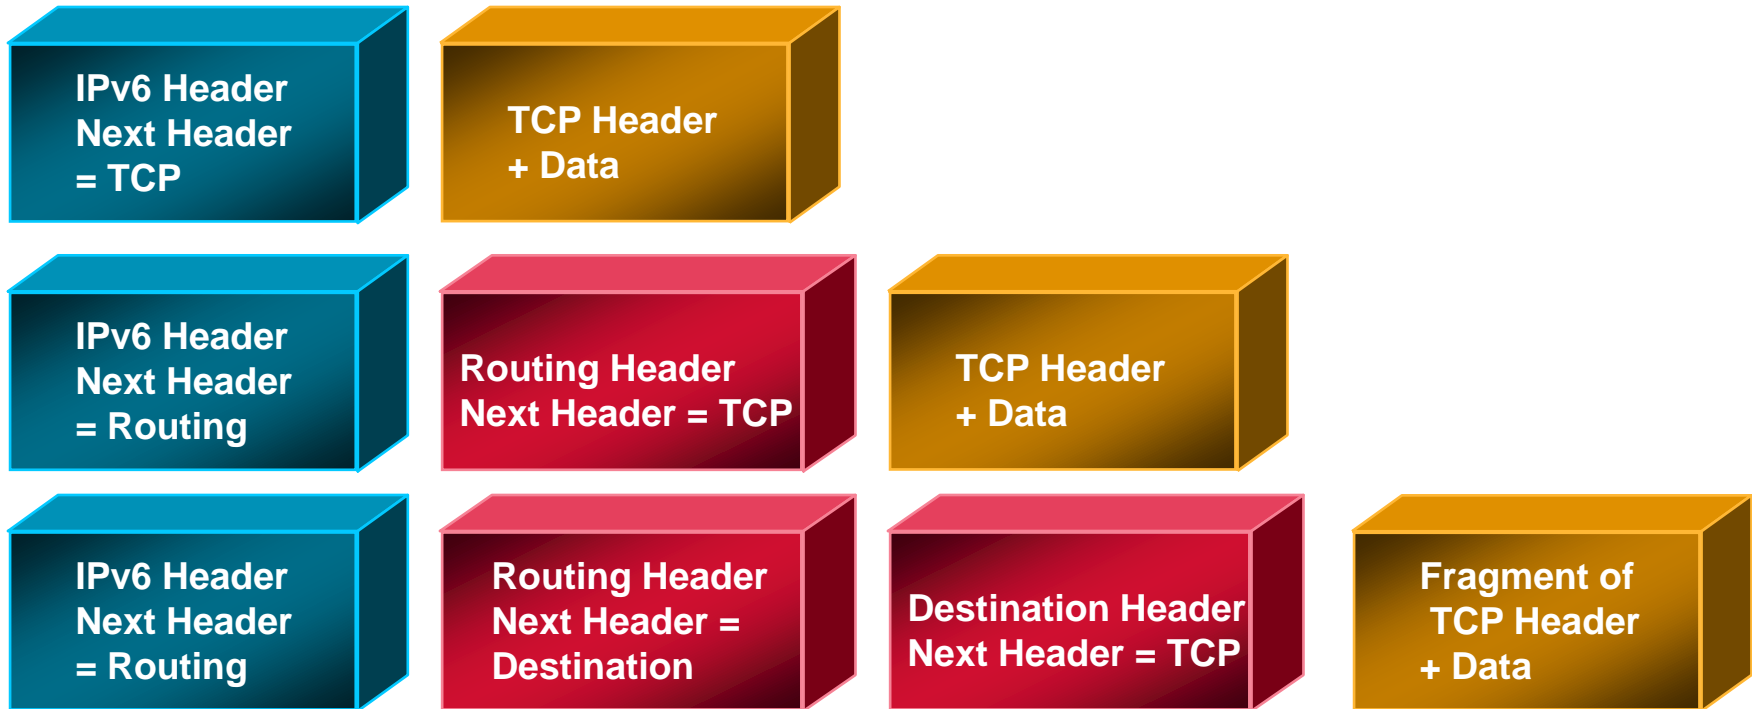

# Extension Headers

## Simpler and efficient header means:

- Extension headers
- Handles the options more efficiently
- Enables faster forwarding rate and end-nodes processing

# Extension Headers

**Extension headers are daisy chained**

# Mobility

## Mobility means:

- Mobile devices are fully supported while moving
- Built-in on IPv6
  - Any node can use it
- Efficient routing means performance for end users

# Security

## Security means:

- End-to-end network security (integrity, authentication, confidentiality)
- Built-in on IPv6
  - Any node can use it

# Transition Richness

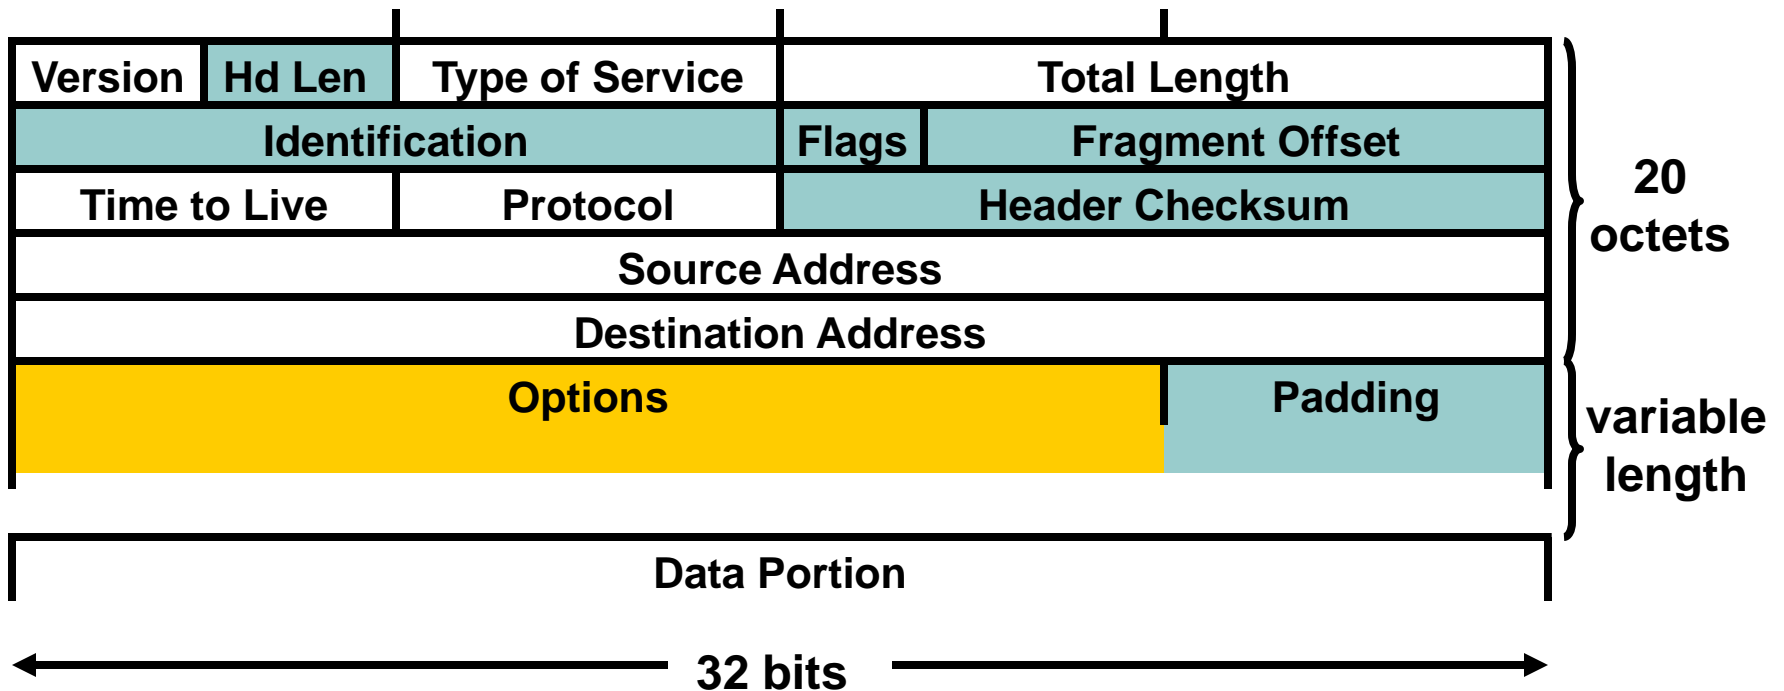

## Transition richness means:

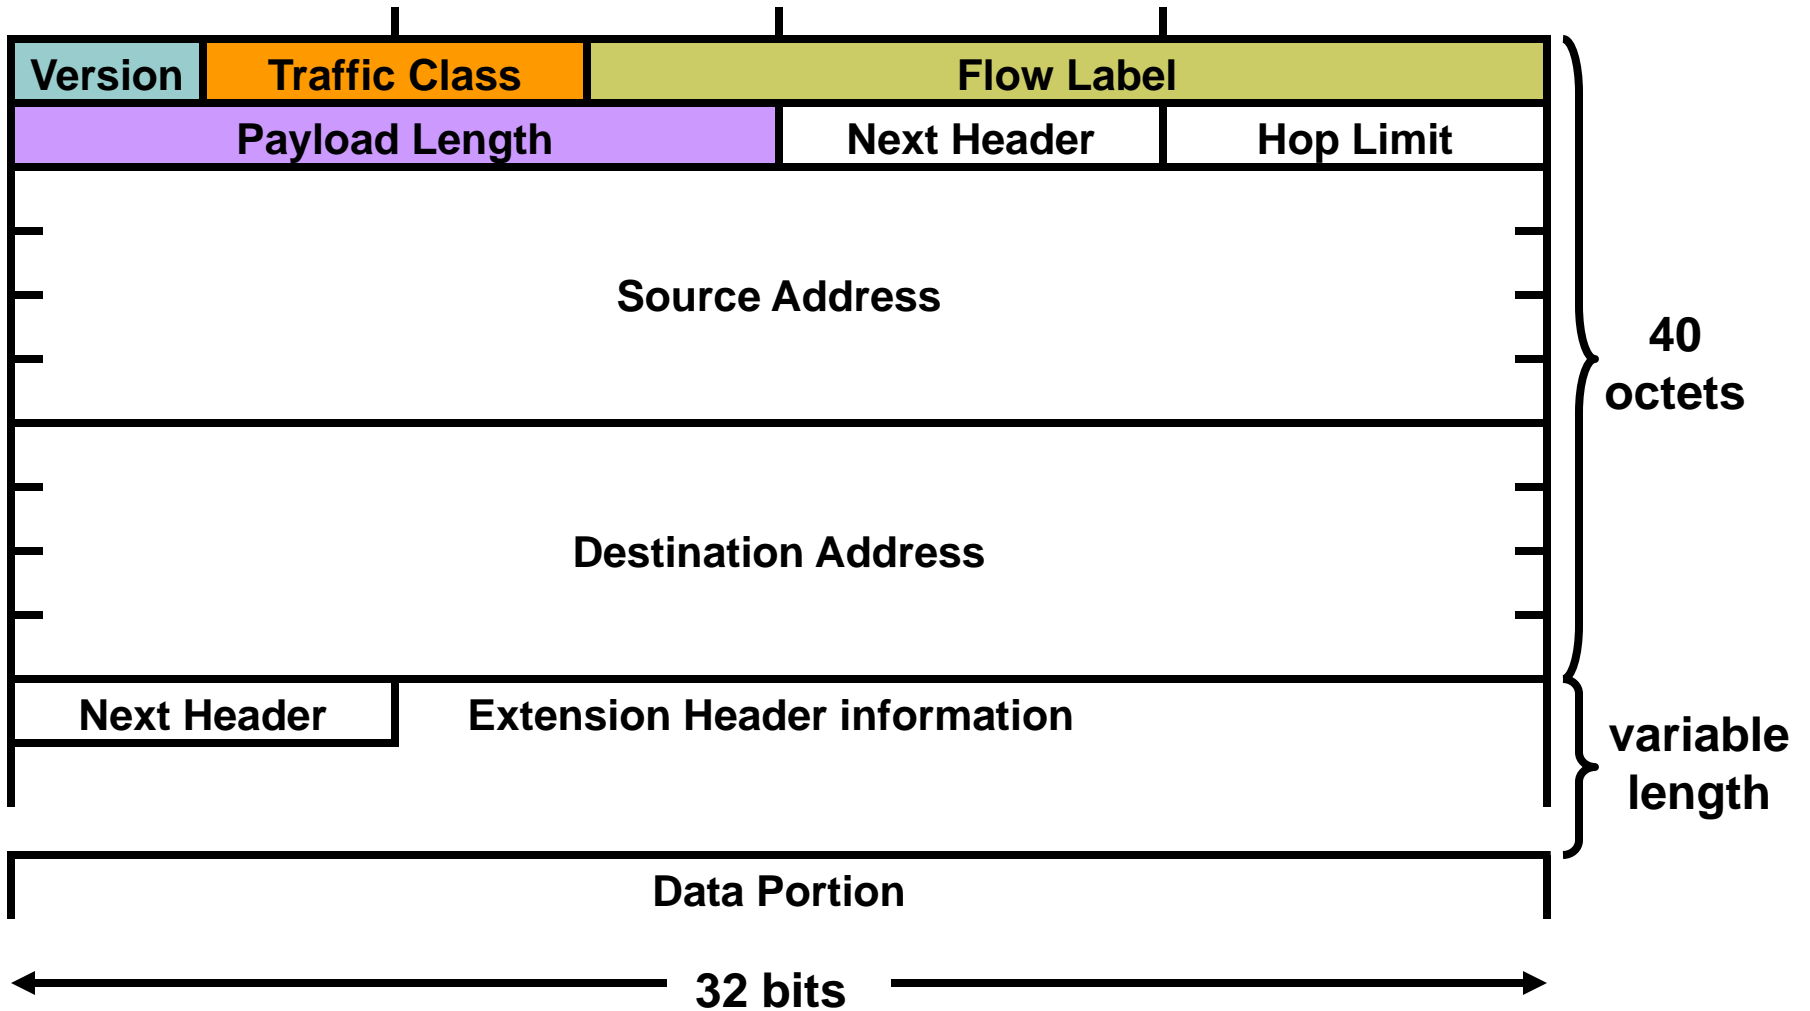

- No fixed day to convert, no need to convert all at once
- Different transition mechanisms are available
  - Smooth integration of IPv4 and IPv6
- Different compatibility mechanisms
  - IPv4 and IPv6 nodes can talk communicate

# **Module 1.3: IPv6 Header Format**

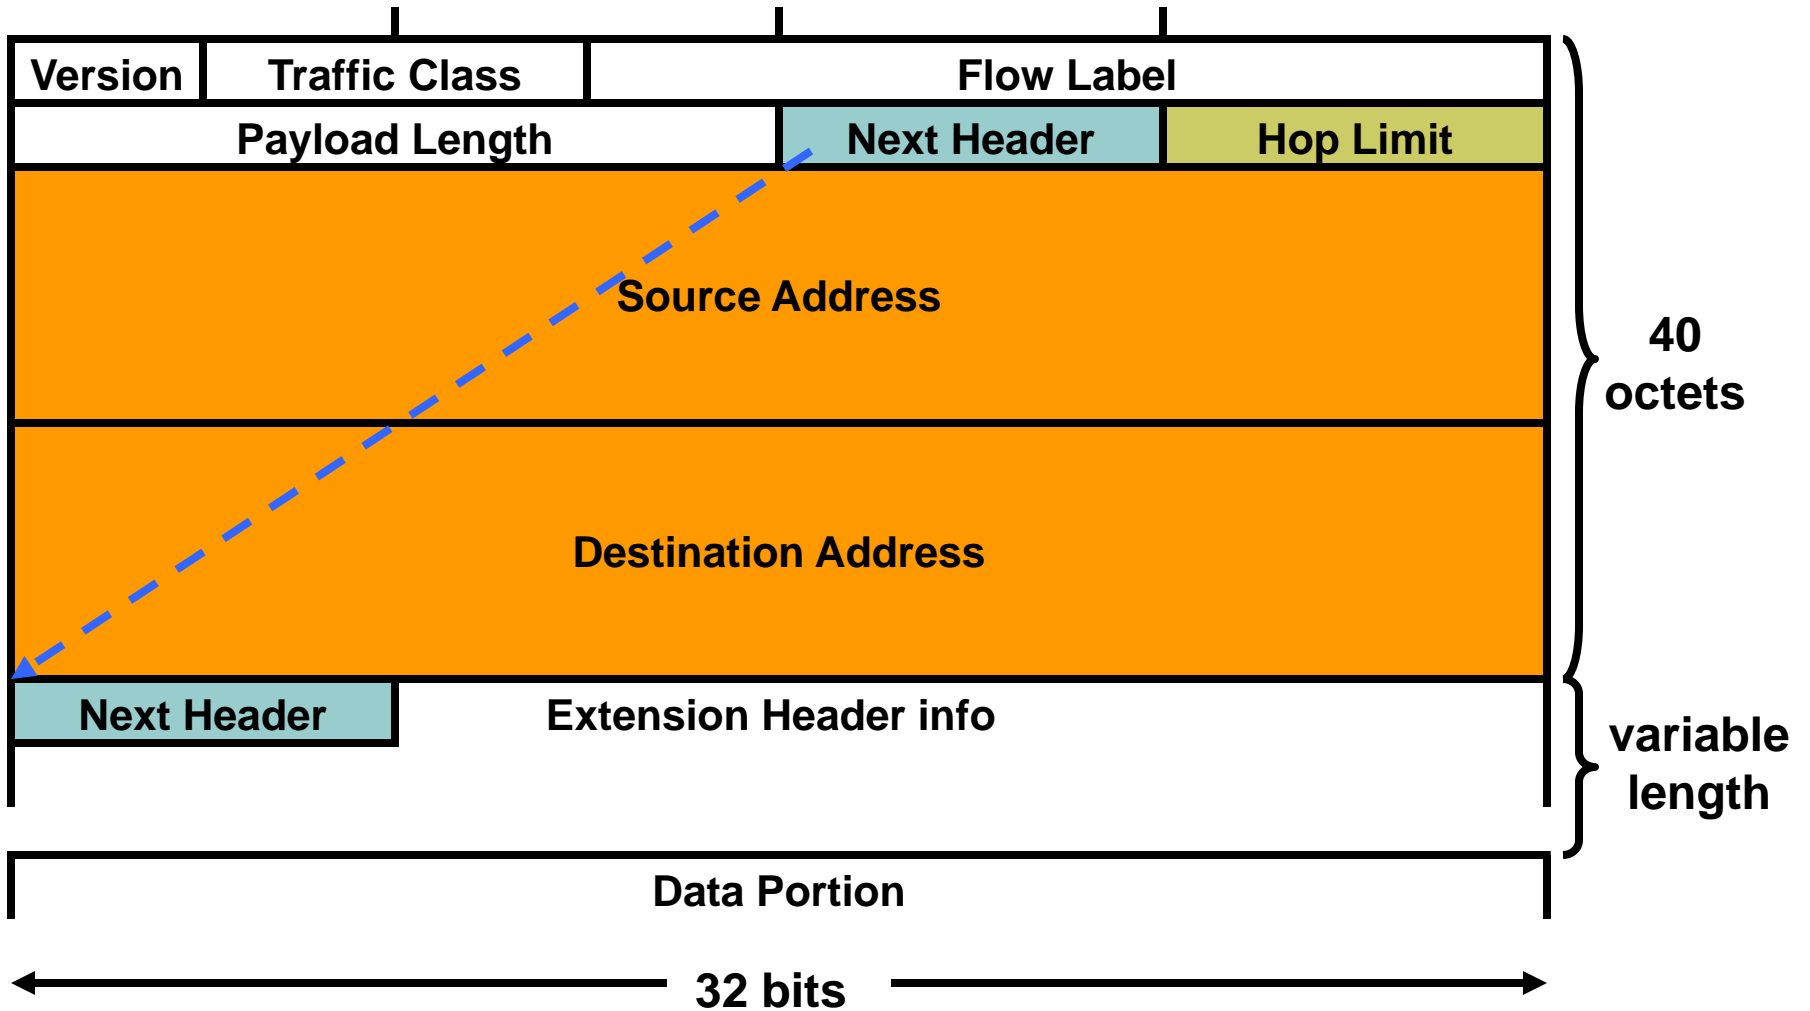

# IPv4 Header Format

# IPv6 Header Format

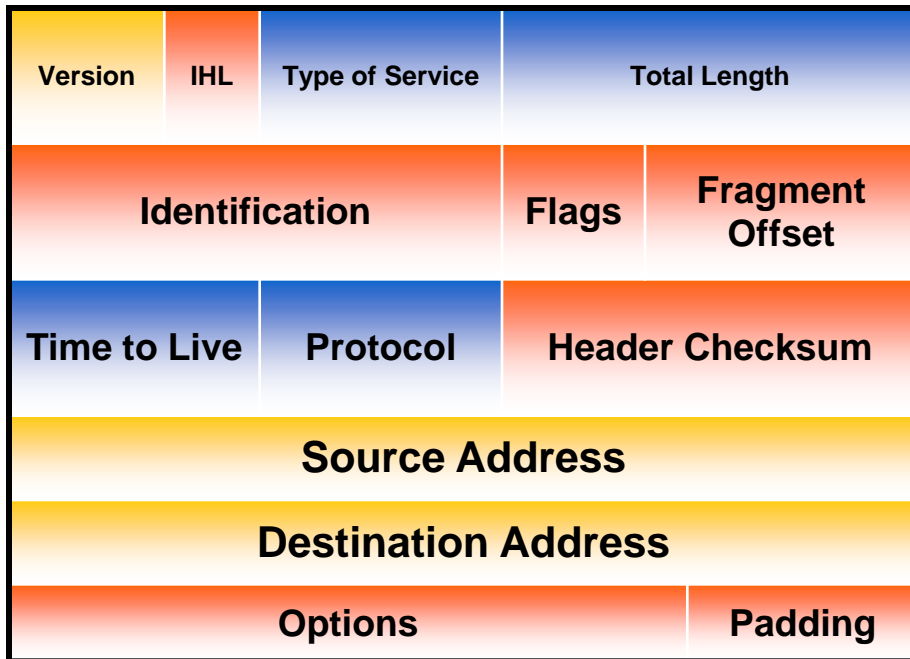

# IPv6 Header Format (Cont.)

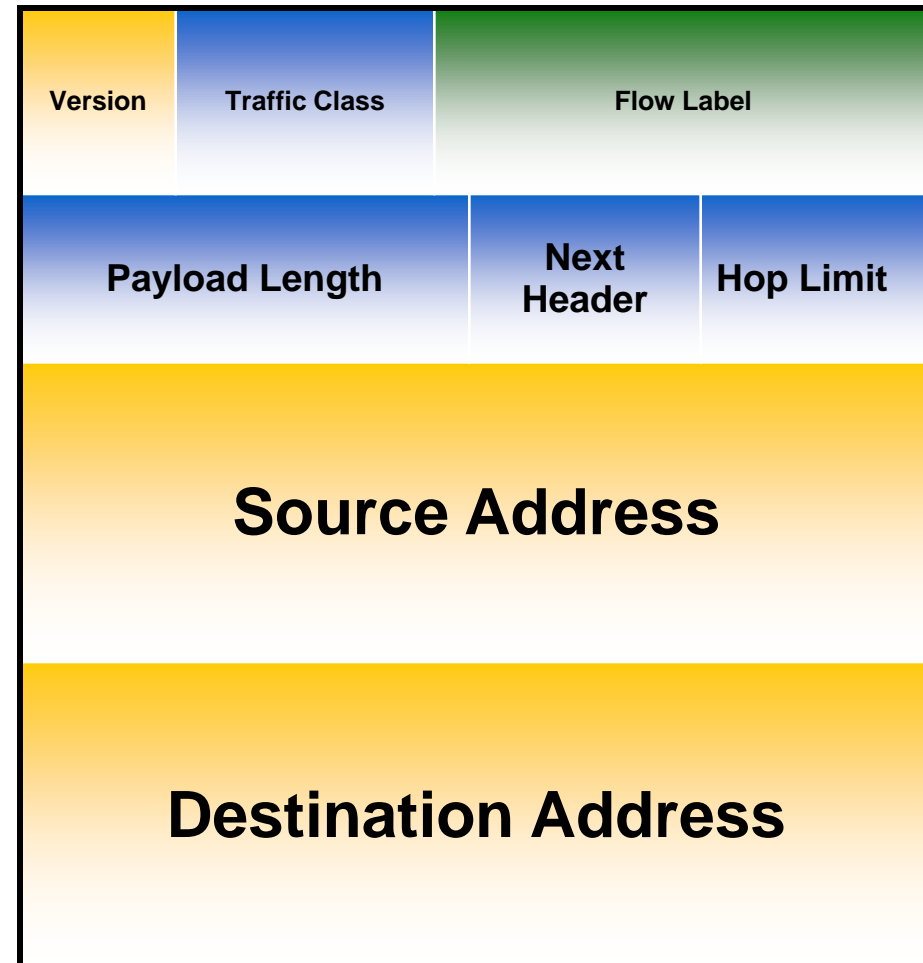

# IPv4 & IPv6 Header Comparison

## IPv4 Header

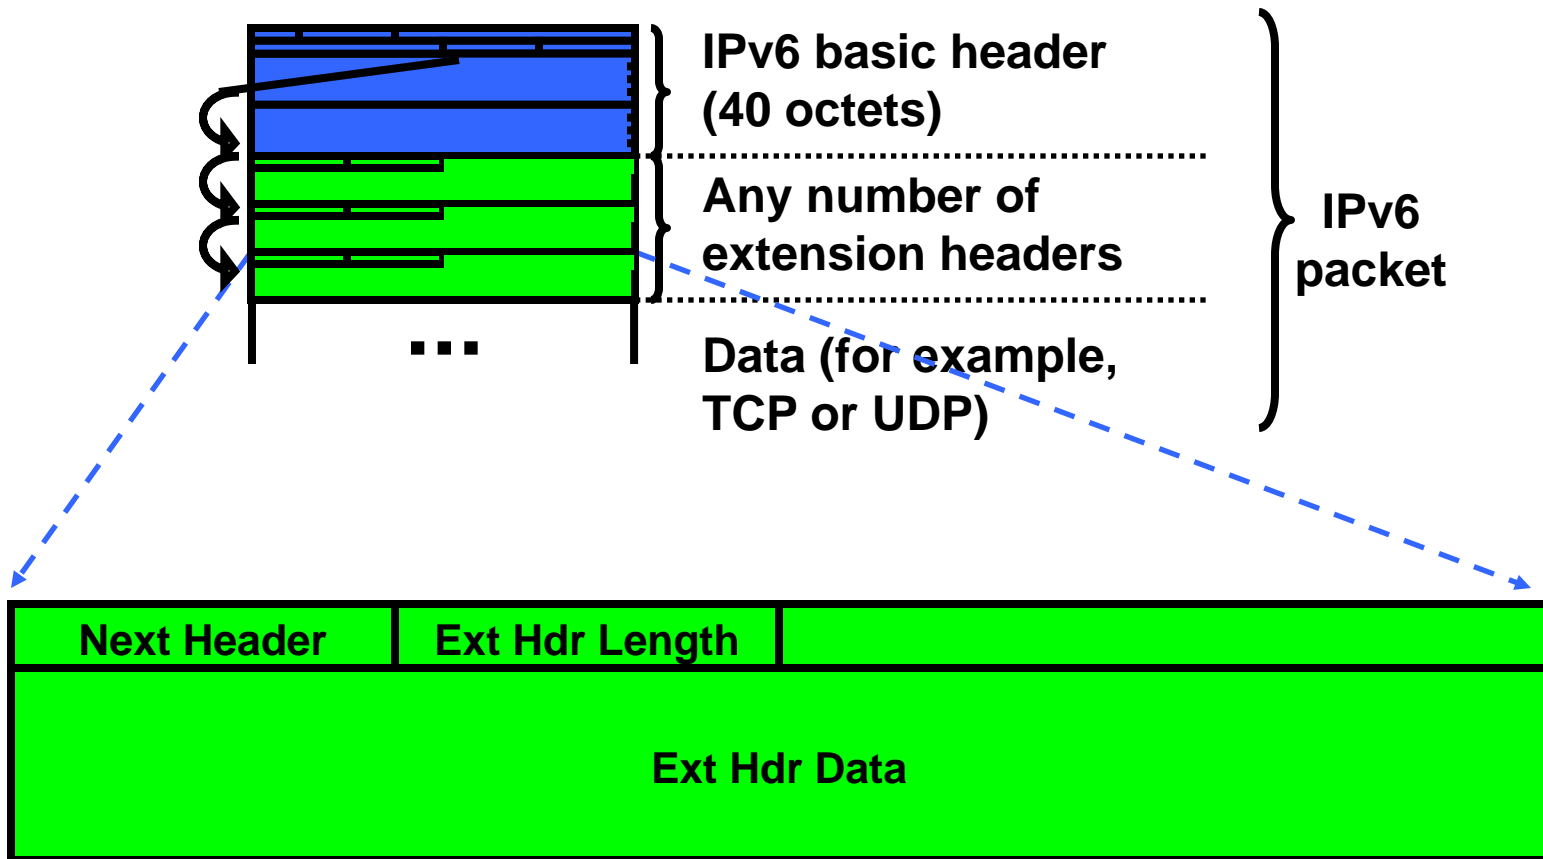

## IPv6 Header

- Legend**
-  - Field name kept from IPv4 to IPv6
  -  - Fields not kept in IPv6
  -  - Name and position changed in IPv6
  -  - New field in IPv6

# Extension Headers

# Extension Headers

---

## **Hop-by-Hop header**

- **Processed by all hops in the path**

## **Destination Option header**

- **Processed only by the destination node**

## **Source Routing header**

- **Combines IPv4 strict/loose source routing concepts**

## **Fragment header**

## **AH and ESP header**

- **Used within IPSec**
- **Identical to the IPv4 version**

## **Upper-layer header:**

- **Used for the transport function (TCP or UDP)**

# Routing Header Format

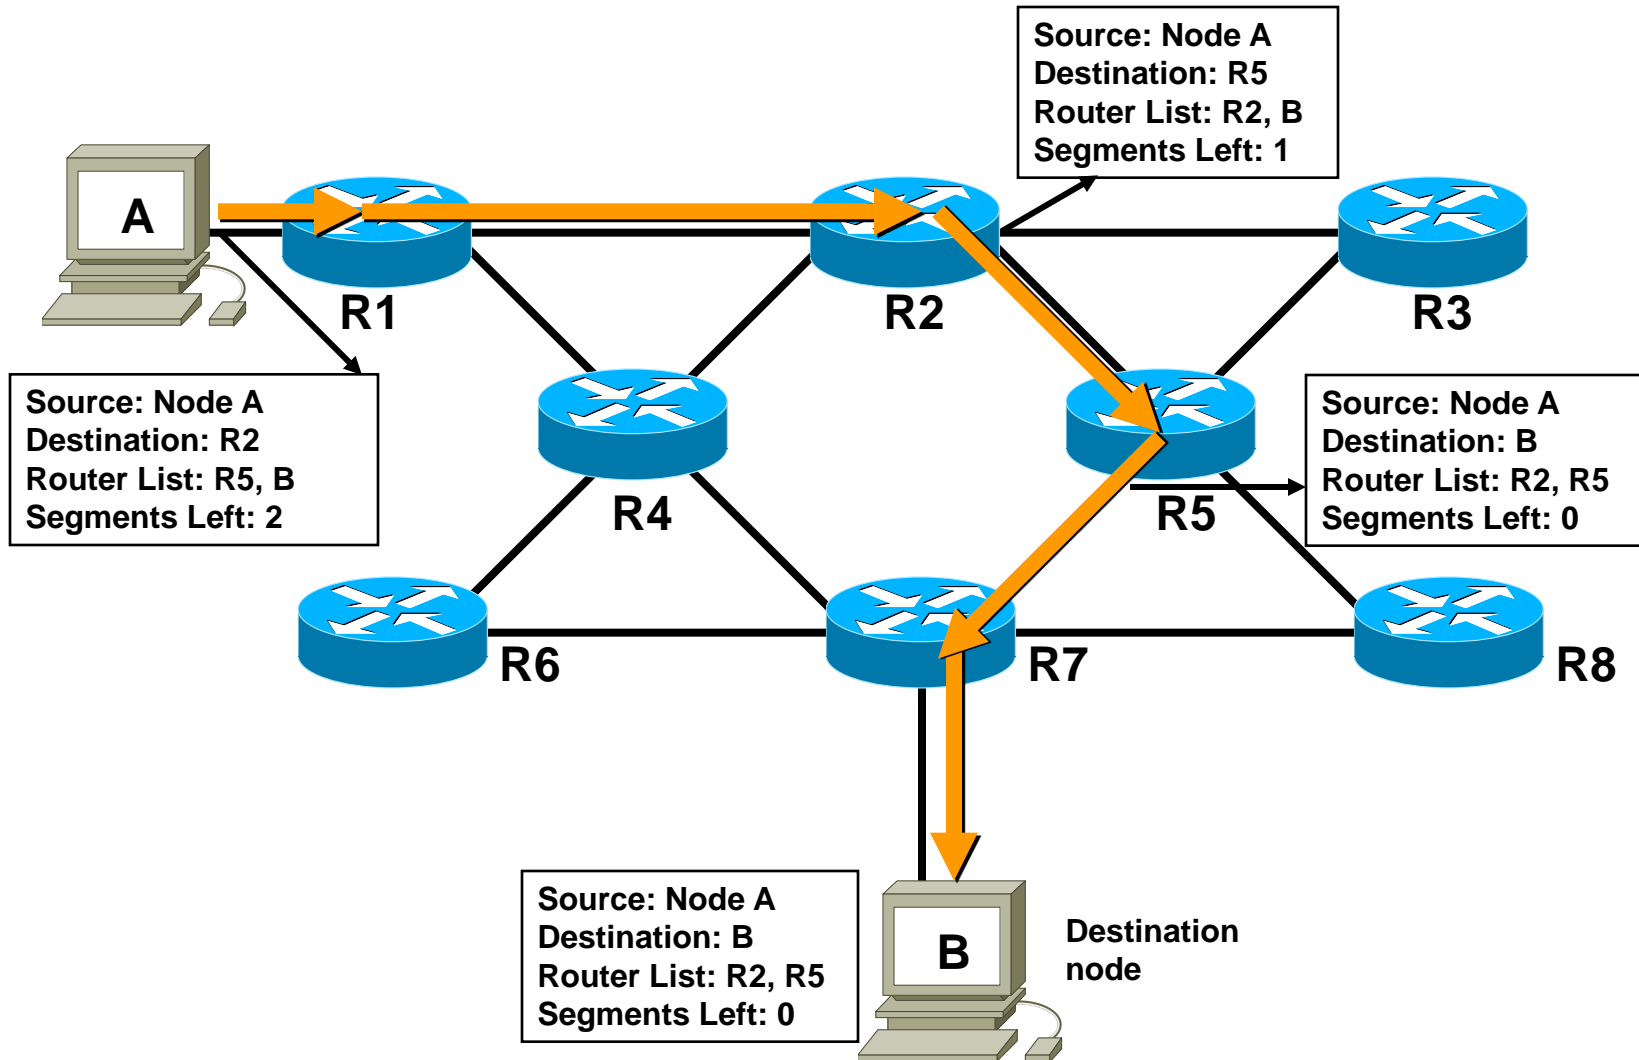

**Routing header is:**

- An extension header
- Processed by the listed intermediate routers

# Source Routing Header Operation

# Source Routing Header Operation (Cont.)

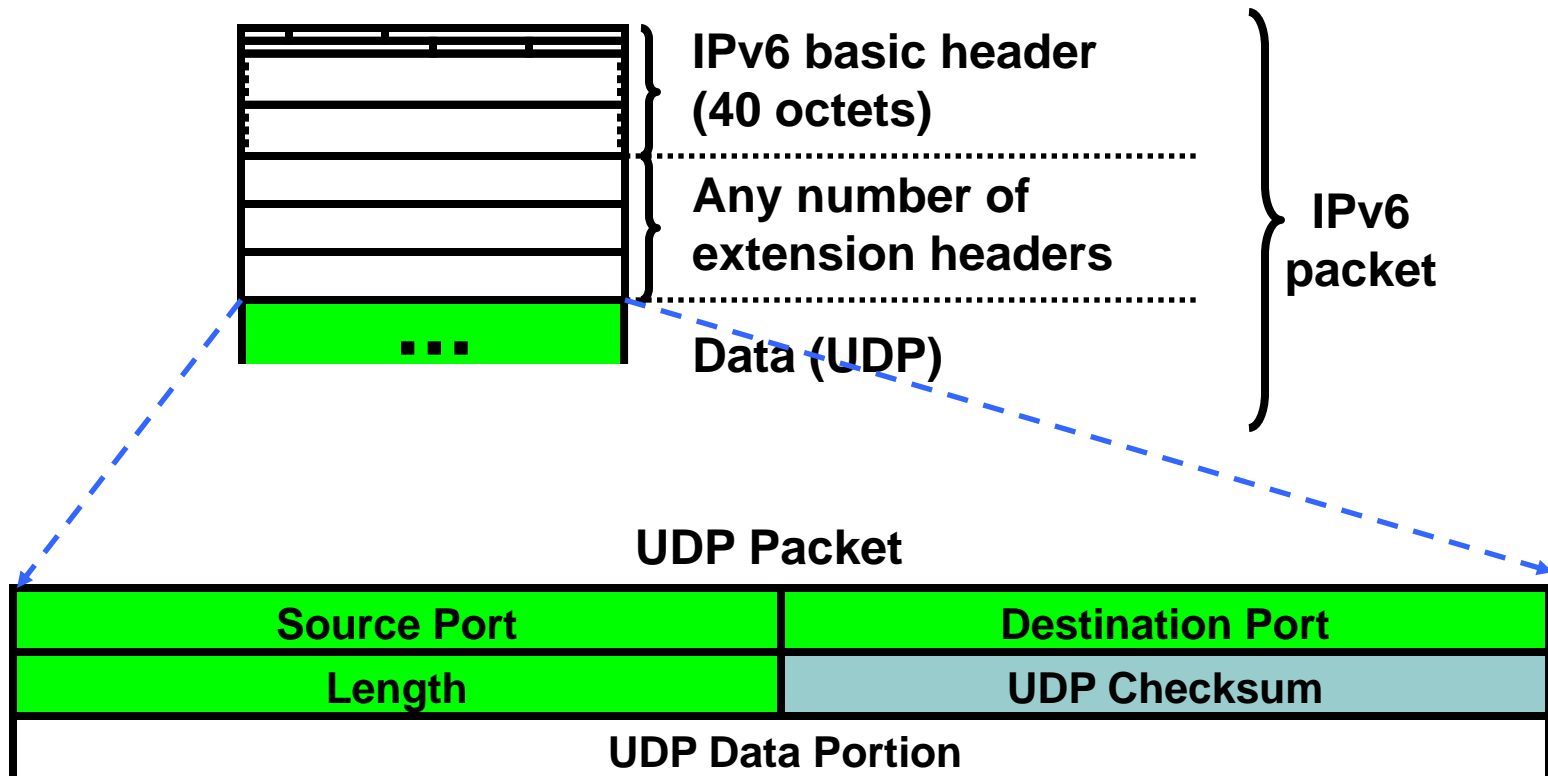

# Fragment Header

A fragment header is used when a node must send a packet larger than the path MTU.

# User Datagram Protocol

**UDP checksum must be computed.**
